

ICK DEATH

Order Flow Analysis — Current State & Direct Checkout Proposal

Product: Seat Safe Tabs | Saorsa Technocrat Pvt. Ltd | September 2026

CURRENT

Existing Purchase Flow

The ICK DEATH website is a **static marketing landing page** built with Next.js 16 and deployed to GitHub Pages. There is no backend, database, user accounts, cart, or payment processing. All commerce is delegated to third-party marketplaces.

Architecture Today

Layer	Implementation
Frontend	Single-page Next.js app (static export)
Backend / API	None
Database	None
Auth / Users	None
Payment	None (Amazon.in & Flipkart redirect)
Order tracking	Handled by marketplace after redirect
Contact	mailto:hello@ickdeath.com in footer only

Current User Journey

Landing Page (ickdeath.com) → User clicks "Buy Now" (Header or Hero) → Buy Now Modal opens → User chooses Amazon OR Flipkart → Opens marketplace in new tab (external checkout) → Order, payment, shipping, tracking handled entirely by marketplace

Key Components (Current Codebase)

File	Role
src/components/BuyNowButton.tsx	Opens purchase modal
src/components/BuyNowModal.tsx	Amazon / Flipkart link chooser
src/lib/buy.ts	Marketplace URL constants
src/components/Footer.tsx	Direct marketplace links + email

Current Flow — Strengths & Limitations

Strengths

- Zero backend cost or maintenance
- Fast to ship and deploy
- Marketplace handles payment, fraud, returns
- Built-in customer trust (Amazon/Flipkart)
- No PCI/compliance burden on you

Limitations

- No customer data or direct relationship
- Marketplace fees (15–25%+)
- No control over pricing, packaging, UX
- Cannot upsell, bundle, or run own promos easily
- No WhatsApp or direct communication channel
- Dependency on marketplace listing status

PROPOSED

Direct Website Checkout (Single Product)

Enable customers to buy **Seat Safe Tabs** directly on ickdeath.com without creating user accounts. Orders are tracked via **WhatsApp** instead of a customer login portal.

Proposed Checkout Steps

- 1 Product page — click "Buy on Website"
- ↓
- 2 Contact info — Name, Phone (WhatsApp), Email
- ↓
- 3 Delivery address — Pincode, city, state, full address
- ↓
- 4 Quantity — select units (single SKU)
- ↓
- 5 Payment — Razorpay / UPI / Cards
- ↓
- 6 Order confirmation — Order ID shown on screen
- ↓
- 7 WhatsApp updates — confirmed → packed → shipped → delivered

Design Principle: No User Database

You do **not** need a separate "user accounts" system. Guest checkout is the right model for a single-product D2C brand at this stage. What you *do* need is an **orders store** — not a user database.

Concept	Needed?	Why
User accounts (login/signup)	NO	Overkill for 1 product; adds friction
Orders database / sheet	YES	You must record who ordered, what, where, payment status
Session during checkout	YES	Temporary — only while user completes the form
Order lookup by phone + order ID	OPTIONAL	Simple status page without login

Is This a Good Approach?

Verdict: Yes — with adjustments

Guest checkout + WhatsApp tracking is a solid, low-friction approach for a single-product Indian D2C brand. It matches how many early-stage D2C brands operate. The key is storing orders reliably and automating WhatsApp messages — not building a full user system.

What Works Well

- **Guest checkout** — Removes signup friction; most Indian D2C buyers expect phone + address, not accounts
- **WhatsApp tracking** — High open rates in India (~90%+); customers already use WhatsApp daily
- **Single product** — Simplifies checkout; no cart complexity, no catalog management
- **Phone as identity** — Use WhatsApp number as the natural order lookup key
- **Lower marketplace fees** — Direct sales keep more margin (minus payment gateway ~2%)

Risks & Gaps to Address

Risk	Mitigation
No order database = lost orders	Always persist orders (Google Sheet, Airtable, Supabase, or Notion — even a spreadsheet works at low volume)
Manual WhatsApp updates don't scale	Use WhatsApp Business API (Interakt, WATI, Gupshup) for automated status messages
Payment without backend is unsafe	Never handle card data yourself — use Razorpay/Cashfree hosted checkout
Returns & support	Add WhatsApp support link + clear return policy on confirmation page
Static site can't process orders today	Need server/API layer (see recommended architecture below)
Shipping logistics	Integrate Shiprocket / Delhivery / Porter for labels + tracking numbers

Recommended Architecture (Better Than Pure Manual)

For a single product with no user accounts, this is the **minimum viable stack** that stays simple but reliable:

Website (Next.js) → Checkout form (contact + address + qty) → API route creates order (status: pending) → Razorpay payment → Webhook confirms payment → order status: paid → Auto WhatsApp: "Order #ICK-1234 confirmed!" → You pack & ship via Shiprocket → Shiprocket webhook → auto WhatsApp: "Shipped! Track: [link]" → Delivered → auto WhatsApp: "Delivered. Enjoy!"

Recommended Stack (India, Single Product)

Need	Recommended Tool	Cost / Notes
Hosting + API	Vercel (move off static GitHub Pages for checkout)	Free tier sufficient to start
Orders storage	Supabase (Postgres) OR Google Sheets via API	Sheets OK for <50 orders/day; Supabase for growth
Payment	Razorpay	UPI, cards, wallets; ~2% fee; webhook for confirmation
WhatsApp notifications	Interakt / WATI / Gupshup (WhatsApp Business API)	~₹0.80–1.50 per message; templates required
Shipping	Shiprocket or Delhivery	Auto AWB + tracking link pushed to WhatsApp
Order lookup (optional)	/track?order=ICK-1234&phone=98xxxx	No login — phone + order ID verification

Alternative Approaches Compared

Approach	Best For	Pros	Cons
A. Keep marketplace only (current)	Zero ops, testing demand	No backend, trusted checkout	High fees, no customer data
B. Guest checkout + WhatsApp (your proposal)	Single product D2C, India	Low friction, direct relationship, good UX	Needs backend + fulfillment ops
C. WhatsApp-only ordering (no website checkout)	Very early, manual fulfillment	Simplest to build	Unprofessional, hard to scale, no payment automation
D. Shopify / Dukaan / WooCommerce	Want turnkey e-commerce fast	Built-in checkout, orders, payments	Monthly cost, less brand control, still need WhatsApp plugin
E. Hybrid: Website + Marketplace	Best of both worlds	Direct sales + marketplace discovery	Two fulfillment channels to manage

Recommended path: Option E (Hybrid)

Keep Amazon/Flipkart for discovery and trust, but add direct website checkout for customers who found you via Instagram, ads, or word-of-mouth. Many D2C brands run both channels — direct for margin, marketplace for volume.

Suggested Checkout Flow (Refined)

Small improvements to your proposed order of steps:

1. **Product + Quantity first** — Show price total early so user commits before filling forms
2. **Contact info** — Name, WhatsApp number (required), Email (optional but useful for receipts)
3. **Delivery address** — Pincode first (auto-fill city/state), then street address
4. **Order summary** — Product, qty, subtotal, shipping, total
5. **Payment** — Razorpay (UPI preferred in India — show UPI prominently)
6. **Confirmation page** — Order ID, estimated delivery, "You'll get WhatsApp updates on [number]"
7. **WhatsApp automation** — Instant confirmation message with order details

WhatsApp Message Templates (Examples)

Event	Message
Order confirmed	"Hi [Name]! Your ICK DEATH order #ICK-1234 is confirmed. 2x Seat Safe Tabs — ₹598. We'll notify you when it ships."
Shipped	"Your order #ICK-1234 is on the way! Track here: [Shiprocket link]. Expected delivery: 3–5 days."
Delivered	"Delivered! Hope you love Seat Safe Tabs. Questions? Reply here or email hello@ickdeath.com"

Implementation Phases

Phase	Scope	Timeline
Phase 1 — MVP	Checkout form → Google Sheet orders → Razorpay payment → manual WhatsApp confirmation (you send from WhatsApp Business app)	1–2 weeks
Phase 2 — Automation	WhatsApp Business API auto-messages, Shiprocket integration, /track status page (phone + order ID)	2–3 weeks
Phase 3 — Scale	Supabase orders DB, admin dashboard, inventory alerts, COD option, repeat-order detection by phone	As volume grows

Data You Need to Store (Per Order — Not Per User)

Field	Purpose
order_id	Unique ID (e.g. ICK-20260901-0042)
created_at	Timestamp
customer_name	Delivery & WhatsApp
phone (WhatsApp)	Tracking messages + order lookup
email	Receipt (optional)
address fields	Shipping
quantity	Units ordered
amount_paid	Payment record
payment_status	pending / paid / failed / refunded
order_status	confirmed / packed / shipped / delivered / cancelled
tracking_number	From Shiprocket
razorpay_payment_id	Payment reconciliation

Bottom Line

Your instinct is correct: skip user accounts, use guest checkout, track via WhatsApp. Do not skip an *orders* database — even a Google Sheet is fine to start. Start with Phase 1 (manual WhatsApp), automate in Phase 2 once you have consistent daily orders. Keep marketplace links as a secondary channel during the transition.
